VeilGuard

BROWSER EXTENSION · CHROME · EDGE · FIREFOX

Stop leaks to AI chats before you press Send.

People paste API keys, passwords, customer data and confidential plans into AI assistants and web forms every day. Once it's sent, you can't take it back. VeilGuard checks what you're about to send, in your browser, and lets you mask it first.

WHY IT EXISTS

AI feels private

Prompts are stored, logged and can be used to train models. One paste can expose a client.

The web is full of traps

Fake CAPTCHAs, look-alike sign-in pages and wallet drainers trick people into giving things away.

Leaks are expensive

A leaked key or patient record means fines, breach notices and lost trust. It can't be unsent.

THE GAP IT FILLS

Blocking AI outright

- Staff use it anyway, on personal devices
- Slows everyone down
- Leaves no record of near misses

VeilGuard in the browser

- Lets people use AI safely: checks every prompt, paste and upload
- Masks the risky part in one click, or swaps in placeholders
- Company rules, forced redaction and reports from one console

WHAT IT DOES

1. **Use AI as normal**
   Works on AI chats, search boxes and any site you choose. A green border shows the page is protected.
2. **It checks before sending**
   Passwords, keys, cards, IDs, health and bank data, plus phishing and fake-CAPTCHA tricks.
3. **You choose**
   Mask it, use placeholders, edit or send anyway. Optional on-device AI also catches names and addresses.

BUILT FOR

Healthcare · Banking & finance · Legal · Insurance · Government · Developers · Small businesses · Anyone who uses AI

Private by design. Free to start.

Checks run in your browser · No account needed
Team plans from $15 a month
