VeilGuard Keyboard

FOR ANDROID

The keyboard that stops you oversharing before you hit send.

Every day people type passwords, card numbers, patient details and work secrets into AI chatbots, messages and emails on their phones. Once it's sent, it's gone. VeilGuard Keyboard spots it as you type and lets you hide it first.

WHY IT EXISTS

We paste everything

AI apps and chats feel private, but what you type is stored, logged and sometimes used to train models.

Phones are the blind spot

Work security tools watch laptops. Most stop at the phone, where people now do half their work.

One slip is costly

A leaked card, password or patient record can mean fraud, fines or a lost job, and it can't be unsent.

THE GAP IT FILLS

Ordinary phone keyboards

- Learn what you type, often syncing it to the cloud
- Never warn you that you're about to share something risky
- Offer no controls an employer can rely on

VeilGuard Keyboard

- Checks every message on the phone itself, never in the cloud
- Warns before you send and masks the risky part in one tap
- Optional company rules for regulated teams

WHAT IT DOES

1. **Type as normal**
   A full keyboard: suggestions, autocorrect, emoji, clipboard history, themes and many languages.
2. **It watches quietly**
   Cards, passwords, API keys, IDs, health and bank details are spotted instantly, in any app.
3. **You choose**
   Mask it, swap in a placeholder, edit, or send anyway. You stay in control.

BUILT FOR

Healthcare · Banking & finance · Legal · Government · Developers · Small businesses · Families · Anyone who uses AI

Private by design. Free to start.

Works in every app · No account needed
Every check runs on your phone
